PROJECT OVERVIEW

Wolffish

A personal AI assistant that does real work on your own computer, not just chat.

Available today | Free and open source (MIT license) | Mac · Windows · Linux

Wolffish is an AI assistant you install like any other app. Instead of just answering questions, it **gets things done**: it opens and edits files, uses your web browser, builds documents, slides and spreadsheets, searches the web and runs tasks on a schedule. It remembers how you like to work, asks before doing anything risky, and keeps everything on your own computer. You can use it fully offline, or connect it to the AI service of your choice.

HOW IT WORKS

1. **You ask**
   From the app, your phone, a browser, the command line, Telegram or WhatsApp.
2. **It gathers context**
   Your request, your preferences and what it remembers about your work.
3. **It thinks**
   Using the AI you picked: one on your own machine, or an online service.
4. **It does the work**
   Step by step, on screen, pausing to ask before anything risky.
5. **It remembers**
   It saves what it learned, so next time it already knows.

WHAT MAKES IT DIFFERENT

Your data stays yours
Everything it writes lives in a single folder on your computer. Delete that folder and it's completely gone.

A memory you can read
What it knows about you is kept as plain notes you can open, edit or delete. Nothing is hidden.

Safe by design
Every action is checked before it runs. Risky ones wait for your yes, and the most dangerous are blocked outright.

Organised like a brain
Separate parts handle memory, planning, safety and action, each doing one job well, which makes it predictable and easy to extend.

Easy to teach
Drop a folder with written instructions into it, and it learns a new skill. No programming needed.

English and Arabic
The whole app works in both languages, including right-to-left layout.

40+
built-in skills: PDFs, spreadsheets, web search, voice, screen control and more

6
ways to reach it: desktop, phone, browser, command line, Telegram, WhatsApp

12
AI providers to choose from, including one that runs fully offline

337
released versions, with one-line install and automatic updates

In short: I designed and built Wolffish from end to end: the desktop app, the command-line tool, the phone app, the web version and the documentation. It's free under the MIT license, so anyone can download it, use it and build on it today.
